

OPHORA™

MICRO WHOLE HOME SYSTEM

The Ophora Micro system model is specifically designed for people who are in good health and wish to maintain it.

Most simple carbon based whole home systems are made from petroleum based carbon, just a greener way to remove chlorine. Whereas, our Micro system first implements a “high grade” pre-filter system as well as catalytic carbon and organic coconut shell carbon thereby eliminating the dangerous pollutants that municipalities cannot. With its eight layers of proprietary filtration media, this system was specifically designed for people who are in overall good health and want to ensure it.

Our Micro whole home system is superior to traditional whole house systems which do not remove all heavy metals, fluoride, nitrates, and other pollutants from the source water and are susceptible to mold during periods of non-use.

Micro System benefits:

- Micro filtered pure water to 0.01 microns
- 8 layers of filtration media for significantly higher filtration capability
- No required monthly maintenance, only one simple system check per year
- Built-in UV sterilization
- Delivers re-mineralized, alkalized, ionized, highly anti-oxidant water
- System comes standard with: bio-renew under-the-counter system
- Integrated anti-leak technology
